**Course title:** English for Academic Purposes: Writing and Publication for PhD Students The course is limited, the lecturer of the course decides how many students can get into the subject!

**Course leader:** György Eigner, associate professor, PhD **Lecturer:** Viktória Tafferner tafferner.viktoria@uni-obuda.hu

Course Duration: 14 Weeks Prerequisite: Advanced English Language of the course: English Mode of instruction: hybrid with online and personal (if required) consultation sessions

Credits: 8

Assessment and Grading:

- Participation and Attendance: 10% of final grade
- Draft Submissions (Introduction, Methodology, etc.): 40% of final grade
- **Response to feedback:** 20% of final grade
- Final Manuscript Submission: 30% of final grade

**Description:** This 14-week course is designed for PhD students seeking to enhance their academic writing skills in English, with a particular focus on preparing research for publication. Tailored to support students working on their own research topics, the course provides a structured environment where participants can refine their writing, engage with peer feedback, and navigate the complexities of academic publishing.

Throughout the course, students will:

- Develop advanced writing techniques essential for producing clear, coherent, and persuasive academic texts.
- Learn to structure research papers effectively, with a focus on crafting compelling introductions, well-supported arguments, and impactful conclusions.
- Improve their understanding of discipline-specific language, style, and conventions in academic writing.
- Receive individualized feedback on their work-in-progress, enabling them to make substantial revisions and improvements to their manuscripts.
- Gain insights into the publication process, including selecting appropriate journals, responding to reviewers' comments, and adhering to ethical standards in research and writing.
- Participate in optional peer review sessions, enhancing their critical reading and editing skills while fostering a collaborative learning environment.

# **Expected outcome:**

By the end of the course, students are expected to have made significant progress on their research manuscripts, moving closer to submission for publication. The language of instruction is entirely in English, ensuring that students not only improve their writing but also their overall academic communication skills in an international scholarly context. This course is ideal for PhD students at any stage of their research who are committed to achieving excellence in academic writing and publication.

# Course Curriculum (possible weekly breakdown of themes and work, diversion from this is possible based on individual needs)

# Week 1: Course Introduction & Academic Writing Fundamentals

- Topics:
  - Overview of course objectives and expectations.
  - Introduction to academic writing: characteristics and principles.
  - Understanding the structure of academic papers.
  - Identifying common writing challenges.

# Week 2: Developing a Research Question & Writing the Introduction

- Topics:
  - Crafting a clear and focused research question.
  - The role and importance of the introduction.
  - Strategies for writing engaging and informative introductions.

# Week 3: Literature Review & Building a Theoretical Framework

- Topics:
  - Writing a coherent literature review.
  - Synthesizing sources and building a theoretical framework.
  - Proper citation practices and avoiding plagiarism.

## Week 4: Methodology Section

- Topics:
  - Writing a clear and precise methodology section.
  - Describing research methods and data collection techniques.
  - Addressing reliability and validity in research.

# Week 5: Results & Data Presentation

- Topics:
  - Effective presentation of research findings.
  - Using tables, figures, and charts to enhance clarity.
  - Writing the results section with precision.

# Week 6: Discussion Section

- Topics:
  - Interpreting results and discussing their implications.
  - $\circ$   $\,$  Connecting findings to the research question and literature.
  - Addressing limitations and suggesting future research.

# Week 7: Writing the Conclusion & Abstract

- Topics:
  - Crafting a strong conclusion that reinforces the research significance.
  - Writing a concise and effective abstract.
  - Revisiting the importance of clarity and brevity.

# Week 8: Refining Argumentation & Coherence

- Topics:
  - Strengthening the logical flow and coherence of the paper.
  - Enhancing argumentation and addressing counterarguments.

• Revising for clarity and consistency in academic writing.

# Week 9: Advanced Academic Vocabulary & Style

# • Topics:

- Expanding academic vocabulary relevant to students' fields.
- Understanding discipline-specific style and tone.
- Avoiding common language pitfalls in academic writing.

## Week 10: Peer Review & Editing Skills

- Topics:
  - The peer review process: expectations and responsibilities.
  - Developing effective editing and proofreading techniques.
  - Providing constructive feedback to peers.

## Week 11: Understanding the Publication Process

- Topics:
  - Overview of the academic publishing process.
  - Selecting the right journal for your research.
  - Understanding submission guidelines and processes.

## Week 12: Responding to Reviewer Feedback

- Topics:
  - Interpreting and responding to reviewer comments.
  - Revising and resubmitting based on feedback.
  - Maintaining professionalism in correspondence with editors.

# Week 13: Ethical Considerations & Academic Integrity

- Topics:
  - Ethical issues in academic writing and publishing.
  - Understanding plagiarism and maintaining academic integrity.
  - Authorship and collaboration ethics.

## Week 14: Finalizing Your Manuscript & Course Wrap-up

- Topics:
  - Final checks before submission: formatting, citations, and clarity.
  - Reflecting on the writing and publication process.
  - Course review and feedback.

Note: Further articles will be available to download on the course's virtual learning environment (Moodle).

**Course title:** Advanced Academic English – Scientific Presentation Skills The course is limited, the lecturer of the course decides how many students can get into the subject!

**Course leader:** György Eigner, associate professor, PhD **Lecturer:** Viktória Tafferner tafferner.viktoria@uni-obuda.hu

**Course description:** The ability to deliver an effective and engaging presentation is an essential skill for academics in all disciplines. The course is intended to help early stage researchers develop the skills to present a clear and compelling scientific narrative. Students will have the opportunity to develop their overall oral communication skills as well, use language more effectively with appropriate visual aids, developing audience awareness, delivering and structuring their conference talks, as well as confidently handling Q&A sessions. The course deals with the methodology of delivering a good presentation, stages of planning and preparation, presenting results, leading discussions and engaging with the audience.

**Course objectives:** The aim of this course is to improve the oral communication capacity of the participants by developing skills of spoken communication, with particular reference to an academic context enabling students to deliver more effective and engaging presentations with increased confidence. The course emphasizes the practical element of the dissemination and is based on the participants' own research. Students will work on their own presentation – e.g., a conference or a poster presentation they are about to give. In this way, the course serves as preparation for a given presentation activity.

# **Expected outcomes:**

By the end of the course students would:

- be able to undertake effective planning and preparation for presentations suitable to the target audience and be able to consider the needs of the different audiences for their research in order to tailor their presentations to specific groups and events
- know the fundamental characteristics of effective communication
- be familiar with the basic skills of oral presentation itself, and have been able to practice intensively using their own working materials
- have learned a method to transform scientific research results into attractive, accessible, engaging and structured presentations, and learn how to apply these to their own scientific work
- be capable of handling appropriate visual aids, equipment and support materials
- understand approaches to managing nerves and Q&A sessions in order to deliver presentations with more confidence and control
- be able to apply feedback from peers to develop the content and delivery of their presentations

**Language:** the course is instructed fully in English (all materials are required to be submitted in English)

# **Delivery:** face-to-face

# Target group: PhD students, and graduate research students

**Assessment:** The course emphasizes the practical element of the dissemination and is based on the participants' own research. Students will create their own presentations – e.g. a conference

or a poster presentation they are about to give. They will be required to give 2 practice presentations during the course.

**Pre-requisites:** Advanced English

Hours per week: 1 (class delivered biweekly)

Class time: to be confirmed

**Course content:** Students will work their own presentation. The course will cover aspects such as use of voice, body language, storytelling, methods for building a presentation, the use of visual instruments and structural tools.

# Weekly breakdown of topics to be covered (based on participants background the syllabus might slightly divert from this):

Week 1 and 2 – 12th-23rd February

- Overview of the course, syllabus, introduction to academic skills. Identifying the importance of effective communication in academic settings
- Understanding different types of academic speaking (e.g., presentations, discussions, debates)

Week 3 and 4 – 26th February-8th March

- Developing a clear purpose and message introduction to the structure of presentations
- Introduction to speech structure (introduction, body, conclusion) discussing the importance of a clear thesis statement
- Creating compelling introductions and conclusions developing an effective outline for a presentation

Week 5 and 6 – 11th-22nd March

- Incorporating visual aids into academic speeches discussing the use of technology for presentations
- Creating visually appealing slides and supporting materials the effective use of visual aids

Week 7 – 25th-27th March

- Techniques for effective delivery (eye contact, gestures, posture) introduction to vocal variety and pacing
- Non-verbal communication skills (body language, gestures, eye contact) practice and feedback sessions

28th March – April 2nd – Easter Recess

Week 8 and 9 – 3rd-12th April

- Developing criteria for evaluating academic speeches understanding constructive feedback
- Peer review sessions with a focus on constructive feedback

Week 10 and 11 – 15th-26th April

- Understanding and managing presentation anxiety
- Strategies for handling questions and answers developing quick and thoughtful responses
- Creating engaging audience interactions

Week 12 and 13 – 29th April-10th May

- Final practice peer and instructor evaluations with a focus on improvement
- Final presentations reflection on personal growth, areas for improvement, and setting goals for future presentations

Week 14 – 13th-17th May

• Final Q&A session

# PROGRAM OF APPLIED INFORMATICS

Course title: Computer arithmetics and floating point error analysis

Lecturer: Aurél Galántai, professor emeritus, DSc galantai.aurel@nik.uni-obuda.hu

**Course objective:** Introduction to the most up-to-date computer arithmetics, the floating point arithmetic standard and the elements of interval arithmetic.

Lectures: 20 hours

#### **Course description:**

The basic principles of the floating point error analysis. Multiple precision arithmetics. Basic arithmetic operations. Computational methods for elementary functions. Other types of arithmetic. Introduction to interval arithmetic. Diagnostical tools.

Evaluation method: classical colloquium and/or written solution of a special task

Course title: Application of GIS-based thematic maps

Lecturer: Andrea Pődör, associate professor, PhD podor.andrea@amk.uni-obuda.hu

**Course objective:** Many specialties in which spatial data are displayed use GIS to analyze their data and present problems. The resulting visual solutions, however, can be misleading without a basic understanding of cartography. For this reason, the course aims to provide an overview of the theoretical background, operation, and applications of different visual methods.

Lectures: 20 hours

## **Course description:**

With the advent of GIS, map makers have another important tool at their disposal, but it doesn't matter how we use it. In order to avoid the "black box effect", the main goal of the course is to investigate GIS mapping methods, how we can use software to create thematic maps, and what algorithms are behind each analytical function. What are the procedures that are still a problem. Which tools of cartographic visualization are available in GIS software and their evaluation.

Data analysis, database creation, theoretical model design using subtype and domain.

Examination of data abstraction, cases of group formation of data classification, examination of related representation methods. Problems of classification methods in thematic maps. Basics of designing visualization, from the right color choices to writing. Levels of symbolization. Examining the research results of map use in the light of these.

Graphical representation methods: Basic thematic mapping methods, their software solutions, their applicability. Dynamic and interactive display methods. Problems of two- and multivariate representation methods. Virtual and three-dimensional display space. Possibilities of depicting time.

Generalization in case of special topics, investigation of algorithms supporting generalization. Geovisualization and modern space. Display options for geostatistical analyzes.

**Evaluation method:** classical oral examination.

**Course title:** Advanced Computer Architectures

Lecturer: Dezső Sima, professor emeritus, DSc sima@uni-obuda.hu

**Course objective:** The lecture provides an overview of the evolution of multithreaded, multicore processors subdivided into the processor categories of client, server and mobile processors. The lecture emphasizes the design space concept, interrelations and emerging trends. Case examples support better insight into the subject presented.

Lectures: 20 hours

## **Course description:**

Overview of the evolution of Intel's Core 2 family; client HED, server and mobile processors. Evolution of the client processors; ISA extensions, interconnects, power management, memory and IO connections. Appearance and evolution of AMD's Zen-based architectures. Evolution of multicore server processors. Emergence of mobile devices (smartphones, tables) design paradigm of mobile processors, word market issues, evolution of ARM ISA-based architectures. Evolution of the microarchitecture of mobile processors.

**Evaluation method:** classical oral examination.

## **Recommended references:**

1. The subject, by its very nature, follows the latest developments, which are followed, if at all, by available literature several years late. By contrast, the electronic book made available to students aims to be "up to date" and is rich in ample references to the literature.

**Course title:** *Modelling of Parallel and Concurrent Processes (only in the fall semester)* 

Lecturer: Márta Seebauer, associate professor, CSc seebauer@uni-obuda.hu

**Preliminary knowledge:** algorithms, theory of graphs, computer architectures, C programming

**Course objective:** The basic algorithms and simulation models of parallel and concurrent processes. Hardware and software tools of model's realization.

Lectures: 20 hours

## **Course description:**

The problems of increasing the computing performance. Methods of performance testing. The metric of parallelism and the factors related to parallelization. Functional and data parallelism. The embarrassingly parallel problems.

Development and classification of parallel computing systems. Topography and topology. Flynn's taxonomy. SIMD data parallel architecture, MIMD multiprocessors and multicomputers. GRID systems, virtual supercomputers, cloud computing.

Software tools of parallel and concurrent systems: middleware, programming languages. Debugging and efficiency of parallel algorithms. Message passing and data parallel models. Algorithms using processor farm, mesh, tree, and pipe topology. Realization and efficiency of sorting and filtering algorithms. Shared memory systems. Data integrity and memory consistency models.

## Assessment method: oral exam.

**Course title:** *GPU Programming* 

Lecturer: Sándor Szénási, professor, PhD szenasi.sandor@nik.uni-obuda.hu

**Course objective:** Nowadays, GPU programming is a widely used tool thanks to the well usable programming tools and frameworks. The main topic of this course is the CUDA C programming language developed by NVIDIA Corporation. Students have to complete an individual project work during the semester.

Lectures: 20 hours

## **Course description:**

- 1. Specialties of the GPU hardware
- 2. CUDA C environment
  - a. device model
  - b. memory model
  - c. execution model
- 3. Creating kernels
  - a. using one block
  - b. using multiple blocks
- 4. Synchronization
  - a. inside one block
  - b. between multiple blocks
  - c. streams
- 5. Using shared memory
- 6. Atomic operations
- 7. Further optimization
  - a. occupancy
  - b. optimal block size
- 8. CUDA libraries
  - a. CUBLAS
  - b. cuFFT
  - c. cuRANDOM
- 9. Multi-GPU programming

Evaluation method: classical oral examination.

Course title: Processing from segmentation to object-oriented classification

Lecturer: Malgorzata Wojtaszek Verőné, associate professor, CSc wojtaszek.malgorzata@amk.uni-obuda.hu

**Course objective:** This module aims at introducing on advanced remote sensing and digital image processing knowledge, techniques and skills for getting information from imagery and ability to solve complex tasks based on remote sensing. Introduction to the object-based image analysis (OBIA). Strategy for creating suitable image objects, the main types of image segmentation. Feature extraction as a critical step in classification. Object-oriented classification concepts and methods (algorithms), eCognition approach: rule set, assign class, nearest neighbour classification, fuzzy logic and other advanced classification technics. Emphasis is placed on gaining a practical understanding of the principles behind each technique and a consideration of their appropriateness in different applications.

Lectures: 20 hours

# **Contents of the course:**

Recent trends in remote sensing and earth observation

The fundamentals of image: a mathematical framework to describe and analyze images as two- and three-dimensional signals in the spatial and spatio-temporal domains.

Basic and advanced techniques of digital image processing: it covers the fundamental concepts required to understand and apply commonly used and more advanced algorithms for pre-processing of remotely sensed data, image manipulation and characterisation.

Basic and advanced techniques of image classification: It covers the fundamental concepts of pixel- and object-based classification technics. It focuses on an image classification knowledge, techniques and skills for getting information from imagery and ability to solve complex tasks based on remote sensing.

Object-based image analysis (OBIA). Segmentation methods: contour-based segmentation and its application in digital image processing. Surface segmentation algorithms: histogram and region-based methods.

Segmentation methods in the eCognition environment. Combining different algorithms, the role of hierarchy in segmentation and classification processes.

Feature extraction (e.g. spectral and geometric features, textural measures, neighbourhood relations), the rules for selecting attributes for efficient classification.

Object-based classification (OBIA): basic and advanced methods, with special emphasis on methods using fuzzy logic. Artificial Intelligent (AI) in classification.

Evaluation method: classical colloquium, oral examination

- 2. Thomas Blaschke Stefan Lang Geoffrey J. Hay (2008) *Objekt-Based Image Analysis*. ISBN: 978-3-540-77057-2, Springer

**Course title:** *Digital image processing* 

Lecturer: Várkonyiné Kóczy Annamária, professor, DSc varkonyi-koczy@uni-obuda.hu

**Course objective:** The aim of the course is to familiarize students with the classical and nonconventional meth-ods, together with the theoretical and applicational aspects of digital image processing, com-puter graphics, digital image analysis, and geometric modelling. The accomplishment of the subject establishes and helps the stakeholders to evolve their research skills, as well as the abil-ities of developing new methods, algorithms, and models in the field.

Lectures: 20 hours

# **Contents of the course:**

Methods, algorithms, and models of digital image processing and computer vision. Geometric transformations. Transformed domain methods of digital signal- and image processing, 1D and 2D Fourier transforms, Wavelet transform. Soft computing based methods, fuzzy, neural, anytime techniques. Noise reduction, information enhancement, edge detection, corner de-tection, object search, object recognition, computer vision, computer modeling, 3D reconst-ruction, data compression, camera calibration, real-time processing, code optimization. HDR techniques. Examples, case studies.

Evaluation method: classical colloquium, oral examination

Course title: Cognitive Infocommunications

Lecturer: Attila Kővári, professor, PhD kovari.attila@amk.uni-obuda.hu

**Course objective:** To provide the Students with an overview on the basics of Cognitive Infocommunications, and applications fields connected to the CogInfoCom area.

Lectures: 20 hours

## **Contents of the course:**

Cognitive infocommunications (CogInfoCom) is an interdisciplinary research field that has emerged as a synergy between infocommunications and the cognitive sciences a link between the research areas of infocommunications and the cognitive sciences. The primary goal of CogInfoCom is to provide a systematic view of how cognitive processes can coevolve with infocommunications devices where human brain may interact with these devices using the capabilities of artificially cognitive system.

Content: definitions of CogInfoCom, mode of communication: Intra-cognitive communication, Inter-cognitive communication, type of information that is conveyed between the two communicating entities, and the way in which this is done: sensor-sharing communication, sensor-bridging communication, representation-sharing communication, representation-bridging communication. Application examples in different fields of CogInfoCom. Develop student individual task.

**Evaluation method:** classical oral examination.

- 2. R. Klempous, J. Nikodem, P. Baranyi, Cognitive Infocommunications, Theory and Applications, Springer, 2019
- 3. A. Esposito, G. Cordasco, C. Vogel, P. Baranyi, "Cognitive infocommunications", Frontiers in Computer Science, Vol 5, pp 1-7, 2023

**Course title:** Architecture and function of the Security Operation Center (SOC)

Lecturer: Valéria Póser, associate professor, PhD poser.valeria@nik.uni-obuda.hu

**Course objective:** The subject focuses on the construction and the different components and operation of a large enterprise network security system. Moreover, it concentrates on the various roles of the different security teams. The subject gives insight into the alternatives from an operational view of the enterprise cybersecurity system through primarily open-source based solutions.

Lectures: 20 hours

## **Contents of the course:**

The subject gives an introduction into the structure and function of the SOC – Security Operation Center and into the related roles, through practical examples, partly from a management point of view, partly from the operator's aspect. In addition to the SOC's basic concepts, the students learn about roles, tasks, and responsibilities. They get experience in the implementation, and the operation of cybersecurity functions, based on open-source solutions.

Evaluation method: classical colloquium, oral examination

- 1. Arun E Thomas: Security Operations Center SIEM Use Cases and Cyber Threat Intelligence (CreateSpace Independent Publishing Platform (2018))
- 2. Don Murdoch: Blue Team Handbook: SOC, SIEM, and Threat Hunting Use Cases: A condensed field guide for the Security Operations team (Volume 2) (CreateSpace Independent Publishing Platform; 1.0 edition (2018))

Course title: Digital Signal Processing and its Applications

Lecturer: Gyula Simon, professor, PhD simon.gyula@amk.uni-obuda.hu

**Course objective:** The students will be able to understand the underlying principles of digital signal processing, with special emphasis on practice and applications. The Theoretical results will be illustrated by practical examples. Students will implement their own signal processing algorithms.

Lectures: 20 hours

## **Contents of the course:**

Foundations of signal processing (Discrete time systems, linear time invariant systems, discrete time systems, time and frequency domains, Fourier Transform, DFT, z-transform). Sampling in time domain (sampling theorems, sub-sampling and over-sampling). Sampling in amplitude domain (A/D and D/A converters). Digital filters (FIR and IIR filters, digital filter structures, FIR filter design, IIR filter design). Discrete Fourier transform and its applications (windowing, FFT, circular and linear convolution). Adaptive filters (Wiener filter, LMS algorithm, the Kalman filter).

Evaluation method: classical oral examination.

**Course title:** *Deep machine learning techniques* 

Lecturer: Gábor Kertész, associate professor, PhD kertesz.gabor@nik.uni-obuda.hu

**Course objective:** In the last 10 years the field of artificial intelligence has once again become an active research area, caused by deep neural networks and deep learning. The application of deep learning in the field of computer vision produced results that previously seemed unachievable, and in recent years solutions based on deep machine learning emerged in technically all fields of science. During the semester, after learning the basic concept of deep learning, students will get to know different techniques on applications in computer vision and natural language processing, in practice as well.

Lectures: 20 hours

# **Contents of the course:**

Fundamentals of deep learning. Mathematical background, optimalization. Overfitting, regularization techniques. Learning from image data, convolutional neural networks. Processing time-series data, recurrent neural networks. Natural language processing.

**Evaluation method:** classical oral examination.

Course title: Physiological and Pathophysiological controls

Lecturer: Levente Kovács, professor, PhD kovacs@uni-obuda.hu

**Course objective:** In case of many diseases, where the human body is not able to create or maintain the healthy conditions, sometimes an external controller could be the solution which must fulfill a very strict set of requirements but it is not just improving patients' quality of life but – if needed – it could contribute to the proper dosing of medications. The thoughts above describe the subject of physiological control which is one of the thirteen branches of the biomedical engineering science. The aim of the course is to provide an integrated introduction to the application of control engineering focusing on the most important areas of public health, especially on diabetes. The course is built on two parts: model identification and control engineering.

Lectures: 20 hours

## **Contents of the course:**

Modelling biomedical processes, basics of system theory, classic controller design (PID), state feedback, Kálmán-filter, identification of linear systems, model-predictive control, modern robust control.

Course title: Modern robust and nonlinear control

Lecturer: Levente Kovács, professor, PhD; Dániel András Drexler, associate professor, PhD; György Eigner, associate professor, PhD <u>kovacs@uni-obuda.hu</u> <u>drexler.daniel@nik.uni-obuda.hu</u> <u>eigner.gyorgy@nik.uni-obuda.hu</u>

**Course objective:** The purpose of the subject is to introduce the latest results of control engineering from the viewpoint of biomedical engineering. The primary goal of modern robust control is to satisfy the predefined requirements against quality (related to stability primarily) and provide appropriate control action even in worst case scenarios. These can be provided by using exact mathematical and control formalism. The aim of the subject to introduce these knowledges to the students. The subject builds on MATLAB as programming framework. The subject details the transition between non-linear and linear systems, focusing on the Linear Parameter Varying (LPV), Robust Fixed Point Transformation (RFPT) and Tensor Product (TP) based control solutions. In the second part of the subject the investigation of non-linear control solutions are in the focus, starting from the system classes and basics of system theory to the exact linearization, path planning and path tracking controls.

Lectures: 20 hours

## **Course description:**

Basics of system theory; state feedback; Kalman-filtering, H2 and/or H $\infty$  control;  $\mu$ -synthesis, handling of uncertainties, LPV modeling and control, RFPT method, TP method, nonlinear systems and classification of them, Lie algebra, controllability, observability, exact linearization, path planning and path tracking controls.

#### ÓBUDA UNIVERSITY DOCTORAL SHCOOL OF APPLIED INFORMATICS AND APPLIED MATHEMATICS

Course title: Biomedical applications of regression models

**Lecturer:** Tamás Ferenci, professor, PhD; Levente Kovács, professor, PhD <u>ferenci.tamas@nik.uni-obuda.hu</u> <u>kovacs@uni-obuda.hu</u>

**Course objective:** The multivariate regression models are the fundamental tools of the analysis of – amongst many other fields – empirical medical research because it makes it possible to separate the effects (with given model assumptions) thus causal inference – and its quantification – from observational data and increase of study's power in clinical trials is achievable. The course assumes the knowledge of basic regression modelling and based on that introduces advanced topics like the advanced model diagnostics, model building strategies, dealing with missing data, generalised linear models, mixed effect models and generalised additive models. The course introduces the use of R software environment to solve practical problems with it.

Lectures: 20 hours

## **Contents of the course:**

Basics of regression modelling, modelling strategies, logistic regression, characteristics of survival data, generalised additive models, logic of fixed and random effects, predictive models.

Evaluation method: classical oral examination.

- 1. Frank Harrell: Regression Modeling Strategies With Applications to Linear Models, Logistic and Ordinal Regression, and Survival Analysis. Springer, 2015
- 2. Ewout W. Steyerberg: Clinical Prediction Models A Practical Approach to Development, Validation, and Updating. Springer, 2019

Course title: Biomedical experiment design and analysis

**Lecturer:** Levente Kovács, professor, PhD; Miklós Kozlovszky, professor, PhD <u>kovacs@uni-obuda.hu</u> <u>kozlovszky.miklos@nik.uni-obuda.hu</u>

**Course objective:** The standards of design, implementation and analysis of biomedical experiments must match to the requirements of many disciplines. The trials raise medical, ethical, legal and economical questions and all these factors have to be satisfied at once with well controlled processes. The Evidence Based Medicine (EBM) is a requirement to make standardized, comparable studies all over the world in order to provide a foundation to the medical expert's daily work and to prepare a clinical protocol. The course has three parts. In the first half of the semester the factors and steps of design of trials will be discussed including the definition and methods of trial design as a general scientific method and the basics of animal and clinical trial design. The second main part is discussing the two classical approach of trial analysis: the basics of frequentist and Bayesian biostatistics, applicable tests and analysis and the comparison of the two approach.

The last part presents the practical use of the theoretical topics in a particular medical field which is oncology. This involves the evidence based oncological approach, design of clinical trials in oncology, Bayesian clinical trials in oncology and the statistics analysis of oncological trials.

Lectures: 20 hours

## **Contents of the course:**

Factors and steps of design of trials, evidence based medicine, analysis of trials, of frequentist and Bayesian biostatistics, examples in oncology.

Evaluation method: classical colloquium, oral examination

#### ÓBUDA UNIVERSITY DOCTORAL SHCOOL OF APPLIED INFORMATICS AND APPLIED MATHEMATICS

**Course title:** *Methods and practice of health-technology assessment (HTA) for medicines and medical devices* 

Lecturer: László Gulácsi, professor, PhD gulacsi@uni-obuda.hu

**Course objective:** The aims of the course are to get acquainted with the concept, methods, fields of application and practice of HTA, with special regard to the role of HTA in supporting decisions related to medical technologies.

Lectures: 20 hours

# **Course description:**

Health technology assessment (HTA) is the science of the systematic analysis of health technologies that analyzes the following aspects: a) clinical safety b) process characteristics; (c) effectiveness; (d) efficacy; (e) economic consequences; (f) social, legal, ethical and political issues. The goal of HTA is to prepare health policy, reimbursement and service purchase decisions using a multidisciplinary (economics, statistics, social sciences, epidemiology, and medicine) approaches and tools. During the course, students will learn about the concept, areas of application, main methods and practices of HTA in different European countries, with especial regard to the opportunities and challenges of application of HTA in the field of medical devices.

Evaluation method: classical colloquium, oral examination

- 1. Gulácsi L, Péntek M. HTA in Central and Eastern European countries; the 2001: A Space Odyssey and efficiency gain. Eur J Health Econ. 2014 Sep;15(7):675-80.

**Course title:** *Costing in health care* 

Lecturer: László Gulácsi, professor, PhD gulacsi@uni-obuda.hu

**Course objective:** The aim of the course is to introduce the methods of costing in health care for application in health economic evaluation health technologies and health policy decision making.

Lectures: 20 hours

## **Course description:**

Students will learn the main concepts of costing in health care. They learn methods for identifying, measuring, evaluating and costing the different items in health care. Methods of calculating costs from different perspectives and time frame will be introduced.

Evaluation method: classical colloquium, oral examination.

## **Recommended references:**

Lecturer: Márta Péntek, professor, PhD pentek.marta@uni-obuda.hu

**Course objective:** The main aim of the course is to introduce the methods of health outcome measurement, to review their application to support clinical an financial decision making, with especial regard to their use in the development process of new innovative technologies.

Lectures: 20 hours

## **Course description:**

During the course, students will learn how to assess the impact of diseases and health interventions from different perspectives (patient, patient's family, doctor, healthcare system, society). Particular emphasis will be placed on patient-reported outcomes, methods for measuring individual and societal preferences, and we will discuss options for the joint evaluation of length of life and health-related quality of life. Through the example of specific diseases, we analyse the methodological and practical issues of the application of health

**Evaluation method:** classical oral examination.

#### ÓBUDA UNIVERSITY DOCTORAL SHCOOL OF APPLIED INFORMATICS AND APPLIED MATHEMATICS

**Course title:** *Synthesis of scientific evidence in healthcare: a systematic review and evaluation of the literature* 

Lecturer: Márta Péntek, professor, PhD pentek.marta@uni-obuda.hu

**Course objective:** The aim of the course is to introduce the methods of systematic literature search and analysis of scientific evidence related to health. Students should be able to search for and synthesize studies available in the health literature. Students should be able to evaluate the quality of studies published in the literature and its results on a scientific basis, as well as to communicate their own research results in accordance with international standards.

Lectures: 20 hours

# **Course description:**

Students will learn the main types of clinical trials and economic evaluations, the methods of systematic literature search to identify scientific evidence in healthcare. They master the techniques needed to build a literature search tailored to the research goal and to apply the systematic search in various electronic health literature databases. They learn to evaluate the results of the identified studies and to establish evidence levels. Methods and guidelines will be introduced to enable them to design clinical and health economics studies. Particular emphasis will be placed on quality standards for the reporting of medical and health economic research, which will increase the acceptance and comparability of the study results, as well as will improve the chances of publishing the research in high prectige scientific journals.

**Evaluation method:** classical oral examination.

Course title: Health economic modelling

Lecturer: Zsombor Zrubka, associate professor, PhD zrubka.zsombor@uni-obuda.hu

**Course objective:** The aim of the course is to introduce the main modelling methods used in health economic evaluations and to apply them in practice.

Lectures: 20 hours

## **Course description:**

The cost-effectiveness of health technologies (medicines and medical devices) should be assessed when preparing social security financing decisions. Health economics modeling provides an opportunity to estimate the health benefits and costs of alternative technologies in a comparative way over different time periods. Within the framework of the course, students get acquainted with the main modeling methods (decision trees, Markov models) and the methodology of probabilistic sensitivity testing and will solve practical modeling tasks.

**Evaluation method:** classical oral examination.

Course title: Quantitative synthesis of scientific evidence related to health, meta-analysis

Lecturer: Zsombor Zrubka, associate professor, PhD zrubka.zsombor@uni-obuda.hu

**Course objective:** The aim of the course is to introduce the methods of quantitative evidence synthesis for health outcomes. Students should be able to perform a meta-analysis for the main types of health outcomes.

Lectures: 20 hours

## **Course description:**

Students will learn to evaluate the results of the identified studies in a systematic review, establish evidence levels, to extract and synthesize the data using statistical methods, with especial regard to the methods of meta-analysis.

**Evaluation method:** classical oral examination.

Lecturer: Imre Rudas, professor, DSc rudas@uni-obuda.hu

**Course objective:** Cloud Computing as a new paradigm in Information Technology provides a new horizon in Intelligent Robotics. The Course summarizes the essential cloud computing background and the possible applications in Robotics.

Lectures: 20 hours

## Preliminary knowledge: Robotics

## **Course description:**

Introduction to Cloud Computing: the main idea, basic definitions. The conventional cloud model: essential characteristics, service models, deployment models. Intelligent robotics and their applications especially in service robotics. Cloud minded robotics, the expectations and possible realizations. Public clouds: RoboEarth, ROS, Open Source Robotics Foundation (Gazebo). Developing cloud minded robotic system by using Virtual Collaboration Arena and public clouds.

**Evaluation method:** classical oral examination.

Course title: Robot Modeling and Control

**Lecturer:** Imre Rudas, professor, DSc; József K. Tar, professor, DSc <u>rudas@uni-obuda.hu</u> <u>tar.jozsef@nik.uni-obuda.hu</u>

**Course objective:** To provide the Students with an overview on the basic modeling methods of Classical Mechanics adapted for robots, and that of the classic control approaches.

Lectures: 20 hours

## **Course description:**

Rotation and shift of rigid bodies: the Orthogonal Matrices. Lie Groups. Representation of Lie Groups: quaternions, spinors, Clifford Algebras. Homogeneous matrices and the Special Euclidean Group. The Forward kinematic task, free options, the Denavit-Hartenberg Conditions. The differential inverse kinematic task. Optimization under constarints, Lagrange multipliers and the Reduced Gradient Method, the auxiliary function. Generalized inverses for redundant robot arms: the Moore-Penrose pxeudoinverse, Singular Value Decomposition (SVD) and the SVD-based pseudoinverse, problem solution by the use of the Gram-Schmidt Algorithm, kinematic singularities. Building up the dynamic model of the robot using the kinematic data and the homogeneous matrices. The modified Denavit-Hartenberg conventions. Point to Point (PTP) and Cointinuous Path (CP) control. The Computed Torque Control (CTC) and its behavior for modeling errors and unknown external disturbances. The Robust VS/SM Control. The basics of adaptive controllers: Lyapunov function, function class "kappa", stability definitions, quadratic Lyapunov functions, Adaptive Inverse Dynamics Controller. Application of the Fractional Order Derivatives in control.

Course title: Soft computing techniques and its applications

Lecturer: Várkonyiné Kóczy Annamária, professor, DSc varkonyi-koczy@uni-obuda.hu

**Course objective:** The aim of the course is to give overview about the background, new approaches, theories, advantages, and application possibilities of imprecise computational methods, which have low computational need, are robust against inexact and inaccurate knowledge, and data loss. Dur-ing the lectures tools, theories, and application possibilities of soft computing based methods and machine intelligence will be discussed in detail. Accomplishment of the course will result in the ecquirement of application skills of soft computing and hybrid techniques.

Lectures: 20 hours

## **Course description:**

Conception of 'knowledge', 'optimum', 'preciseness', 'cost'. Principles of intelligent computing. Knowledge representation of soft computing techniques. History of theory and application soft computing techniques. Fuzzy set theory, logic, and decision making. Neuro computing. Genetic algorithms. Anytime techniques. Comparison of soft computing techniques, typical application areas, common elements. Modeling. Task solution and problem solution. Selection of problem solving methods. Solution of complex problems with joint application of different soft computing techniques. Case studies.

Course title: Real-time systems and anytime algorithms

Lecturer: Várkonyiné Kóczy Annamária, professor, DSc varkonyi-koczy@uni-obuda.hu

**Course objective:** The aims of the course are (1) to familiarize students with the newest approaches and results of real-time systems and real-time processing, (2) to deepen the knowledge of the students in anytime processing.

Lectures: 20 hours

### **Course description:**

Optimization. Soft computing techniques. Real-time systems. Anytime systems and programming environments. Requirement analysis of anytime systems, modelling techniques. Information processing with specified response time. Research management in time critical applications. Transients in information processing systems with changing architecture. Handling uncertain and vague information in real-time systems. Case studies.

**Course title:** *Modern medical robotics* 

Lecturer: Tamás Haidegger, professor, PhD haidegger@uni-obuda.hu

**Course objective:** This course aims to present modern surgical technologies and devices to the students—from and engi-neering point of view. Image-guided surgery is one of the main focuses of the class, navigation techniqu-es, methods and employed mathematical formulas are derived. Integrated systems employing robotic de-vices for treatment delivery are also discussed and analyzed from electrical, control and system engi-neering. To solve the homeworks, students must demonstrate a basic understanding of robot control, matrix theory, image processing and network theory.

Lectures: 20 hours

# **Course description:**

Computer-integrated surgical systems, definitions and history; medical imaging modalities, medical image processing theory and practice, image-guided surgery, principal of intraoperative navigation, surgical robots, integrated IGS systems, navigation and guidance, image segmentation and surgical planning, registration algorithm, error assessment in CIS, demonstration with Slicer 3D, demonstration with Plus, demonstration with IGSTK, homework consultation and presentation.

**Evaluation method:** classical oral examination.

Course title: Modern Technics and Technology of Surgery

Lecturer: Tamás Haidegger, professor, PhD haidegger@uni-obuda.hu

**Course objective:** The goal of the class is to get the students acquainted with modern surgical technologies and the supporting technical devices. The course shows the cutting-edge technologies and concepts to be used in the near future. There is a particular focus on minimally invasive surgery and image-guided surgical methods. Students will get acquainted with intraoperative navigation systems and surgical robots. To accomplish the course, students are required to understand the fundamentals of minimally invasive procedures, robot control and medical image processing methods (on a theoretical level). It is required that the students gain an overall image on the future tools of surgery, and at the end of the semester give account on their knowledge within the frames of an exam.

## Lectures: 20 hours

## **Course description:**

Get familiar with modern surgical technologies. Get acquainted with the special design, control, and safety requirements of the field. Minimally invasive surgical techniques. Computer-integrated surgery, surgical robotics, surgical CAD/CAM. The usage of patient data, imaging, and other diagnostic information in the planning and execution of interventions. Design and implementation criteria of medical robots operating in distributed systems. Surgical navigation, theoretical and practical background of electromagnetic tracking. Current research directions of surgery. Surgical ontologies and decision support systems. Automatic execution of surgical subtasks. Assessment of technical and non-technical surgical skills. Ventilation and respiratory monitoring.

### Evaluation method: classical oral examination.

Course title: Path Planning Strategies of Multi-Agent Mobile Robot Systems

Lecturer: István Nagy, associate professor, PhD nagy.istvan@bgk.uni-obuda.hu

Lectures: 20 hours

## The goal of the course:

To introduce students into the basic path-planning and navigations strategies in multi-agent mobile-robot systems.

**Preconditions:** only basic knowledge about mobile-robots path-planning methods, some elementary knowledge about GA and ANN operations.

## **Subject Description:**

Firstly, surveying the basic localization, path-planning, and navigations methods, valid for single agent systems. Surveying the mapping of the environment, SLAM method, how to create a point-represented mobile robot, how to model the environment. After, turn to the MAS (Multi-Agent Systems). Types of agents and definitions. Types of different environment modelling especially for topological (graph-like) maps and potential fields maps (VFF, VFH). Case studies and methods for different graph- searches (A\*, A\*\*, Dijsktra, Bellman-Ford, Floyd-Warshall) and optimal path-planning (Ant Colony, SWARM technology; Q-learning and Reinforcement Learning- RL) procedures. Using Markov decision making in MAS.

Exam Type: Classic written and oral exam

Course title: Embedded Mobile Robotics

Lecturer: Peter Odry, associate professor, PhD odry.peter@uniduna.hu

**Course objective:** An Introduction to Theoretical Issues in Mobile Robot Manufacturing and Control.

Lectures: 20 hours

## **Course description:**

Mobile robot structures and the principle of their operation. Structural elements of mobile robots. Implementation of propulsion mechanisms. Control systems, sensor network selection and embedding. Optimization of embedded surfaces. Sensor technology for two-wheel inverse structures. Structure of a walking robot, balancing robot structure. Structure and embedded surface of six-legged, four-legged and two-legged walker robots. Development of walking algorithms. Autonomous flying objects. Autonomous floating objects and underwater floating objects. Conditions for providing a mobile robot application. Robot localization and navigation.

Implementing and exploring robotic control in an embedded system. Create a map. Interpretation of measurement data. Questions about embedding the algorithms. Technical conditions and embedding issues for real-time image processing. Embedded soft programming procedures on a robot interface.

Course title: Issues of Mobile Robot Optimization

Lecturer: Peter Odry, associate professor, PhD odry.peter@uniduna.hu

**Course objective:** Introduction in the optimization process of mobile robot construction and control.

Lectures: 20 hours

## **Course description:**

Summary of standard optimization procedures, application techniques, and applicability in robotics. Computing needs of optimization procedures, parallel computing options and solutions. Overview and classification of optimization process program packages. Formulation of optimization in mobile robot environment. Specifics of mobile robot optimization.

Formulation of goodness (also known as fitness) or optimum in mobile robot optimization. Uncertainty of quality measurement and correct determination. Questions of robot modelling: kinematic and dynamic model, mathematical model vs. simulation model, what's worth and what's not worth modelling. Optimization opportunities on different models and on the real robot. Choosing to measure the required parameters on the model and the real robot. Robot model and verification of optimum by measuring of a real robot operation. Classification of quality of verification results and estimation of tolerance of optimum.

**Evaluation method:** classical oral examination.

**Course title:** Introduction to Engineering Computational Methods

Lecturer: Aurél Galántai, professor emeritus, DSc galantai.aurel@nik.uni-obuda.hu

**Course objective:** An introduction to a complex and fast developing area which encompasses numerical methods, elements of software and hardware engineering, computer graphics and special application knowledge as well.

Lectures: 20 hours

#### **Course description:**

The aim, the content and the tools of the subject. A short survey of the software/hardware methods, the mathematical methods and the application areas. Computer oriented numerical methods. Basic architectures and their programming characteristics. The floating point arithmetic standards. The elements of interval arithmetic. The methods of linear algebra and nonlinear equations. Interpolation techniques and splines. Numerical derivation and integration. Adaptive techniques. Numerical stability and precision in floating point arithmetic. Computer architecture and algorithmic efficiency. Numerical softwares. Software standards and packages (BLAS, LAPACK, MATLAB, Scilab, stb.). Symbolic software packages (Maxima, Maple, etc.). Graphic visualization. Simulation techniques, the Monte-Carlo method.

**Evaluation method:** classical oral examination or submission of the documentation of the solution of a task.

**Course title:** Engineering Computational Methods 1

Lecturer: Aurél Galántai, professor emeritus, DSc galantai.aurel@nik.uni-obuda.hu

**Course objective:** Computational methods for the large computational problems of linear algebra. Approximation of multivariable functions. Computer methods for differential and integral equations.

Lectures: 20 hours

**Preconditions:** Introduction to Engineering Computational Methods

## **Course description:**

Computer methods for large sparse matrices. The MATLAB sparse package. Interpolation techniques for multivariable real functions. Numerical differentiation and integration of several variable functions. Automatic differentiation. FFT. Computer methods and packages for ordinary differential equations. Finite difference and finite element methods for partial differential equations. Discretization methods for integral equations. Algorithms for parallel computers. Numerical stability problems and the reliability of computed results. Graphical interpretation of the solutions. Program packages (NETLIB, TOMS, NAG, IMSL, etc.).

Course title: Development and application of nature-inspired algorithms

Lecturer: Imre Felde, professor, PhD felde.imre@uni-obuda.hu

Lectures: 20 hours

### **Course objective**

Learning the mathematical background of bio and nature-inspired optimization heuristics and mastering their effective application in solving complex problems. Within the framework of the subject, the theoretical foundations and application possibilities of swarm theory, evolutionary and genetic algorithms are also discussed.

### **Content of the subject:**

- Introduction.
- The swarm theory and the PSO algorithm,
- Evolutionary algorithms, genetic algorithms,
- Implementation of algorithms inspired by nature,
- Parallel processing,
- Application possibilities, practical examples

Evaluation method: classical colloquium, oral examination

Course title: Numerical modeling and optimization of industrial processes

Lecturer: Imre Felde, professor, PhD felde.imre@uni-obuda.hu

Lectures: 20 hours

## **Course objective**

Mathematical knowledge required for modeling machining and production processes and mastering their effective application in problem solving. Within the framework of the subject, the theoretical foundations of finite difference, finite element methods, thermodynamic and transformation modeling techniques are discussed.

## **Content of the subject:**

- Introduction.
- Fundamentals of numerical modeling,
- Finite difference method, finite element method, boundary element method,
- Fundamentals of thermodynamic modeling,
- Estimation of thermal boundary conditions,
- Modeling transformation processes,
- Practical examples

Evaluation method: classical colloquium, oral examination

**Course title:** *Flexible and function driven shape representations* 

**Lecturer:** László Horváth, professor, CSc, PhD, Dr. habil horvath.laszlo@nik.uni-obuda.hu

## About the subject

Subject introduces into currently developing shape representations to fulfill recent new requirements against shape model. In this way, modeling behavioral functional features, complex rigid-flexible structures, and organic shapes are characterized, discussed, and exampled.

## **Purpose and objectives**

Subject supports research which requires recent knowledge about shape centered mathematical modeling and simulation of physical system. It helps student at research in representation of flexible bodies and function driven organic shapes.

## **Issues and topics**

Recent advances in boundary representation of shapes.

Shape model in multidisciplinary contextual environment.

Physical system that includes both rigid elements and flexible structures.

Modeling flexible bodies using Modelica language.

Functional form features with behaviors.

Generation of flexible body model using principle and method of finite element analysis.

T-spline representations, their new characteristics and compatibility with NURBS.

Geometric and organic shapes.

Model of function driven organic shapes.

Shape model for additive and traditional manufacturing processes.

## Laboratory support

Students understand principles, methods, contextual connections and system issues discussing related issues on most advanced experimental models. These models are developed for this subject in the cloud environment of 3DEXPERIENCE system.

Lectures: 30 hours

Evaluation method: examination for checking the theoretical and methodological knowledge.

## **Recommended texts:**

Course title: Modeling engineering structure as multidisciplinary system

**Lecturer:** László Horváth, professor, CSc, PhD, Dr. habil horvath.laszlo@nik.uni-obuda.hu

### About the subject

Physical level model of product or other engineering structure is restricted to contextual part models, connection objects for parts, as well as objects for the related processes, analyses, and controls. Recently, there is a growing tendency to develop increasingly multidisciplinary systems operated engineering structures. Physical level modeling is not enough anymore: systems level modeling is required. This subject includes a set of issues to support research in this area.

## **Purpose and objectives**

Subject supports student to recognize necessity of system based engineering modeling, to understand method which is applied from systems engineering (SE), and to connect system and physical levels of model. It helps student at research in system behavior optimizing and integrated simulation processes. In the context of this subject, phrase engineering structure is applied for multidisciplinary system-based experimental engineering configuration.

## **Issues and topics**

Multidisciplinary systems operated engineering structures.

Functional and logical level modeling in RFLP structure.

Behavior definitions and representations for virtual execution of conceptual model.

Connection of functional and logical components.

Modeling and simulation of multi-body and multi-physic systems.

Representation of content behind information in engineering model.

System level parameter optimization.

Organized simulations for multi-physics and multi-scale systems. Organized simulations for multi-physics and multi-scale systems.

### Lectures: 20 hours

### Laboratory support

Students understand principles, methods, contextual connections and system issues discussing related issues on most advanced experimental models. These models are developed for this subject in the cloud environment of 3DEXPERIENCE system.

#### ÓBUDA UNIVERSITY DOCTORAL SHCOOL OF APPLIED INFORMATICS AND APPLIED MATHEMATICS

Course title: Cyber Physical System (CPS) as it is Realized in Engineering for Robot Systems

**Lecturer:** László Horváth, professor, CSc, PhD, Dr. habil horvath.laszlo@nik.uni-obuda.hu

**Course objective:** Advanced control and operation of system-based product requires paradigm level change in engineering application of information technology. The new paradigm is cyber physical system (CPS) where the great novelty is higher level communication between cyber and physical units mainly by utilizing intelligent sensor system power. Cyber activities in CPS also require higher level communication between lifecycle servicing model of CPS and operating CPS. Robot system is a main problem area in the world of CPS because of its high complexity and multidisciplinary character. At the same time, robot system which is contextually integrated in its environment have increasing importance and widespread in many industrial areas. Students understand necessity and means of connections between model and operating forms of CPS systems, familiarize themselves with the relevant elements of the two systems, recognize consistent contexts, and understand CPS model support for CPS operation. In the meantime, related issues in robot systems are also given. Subject helps student at research in driving connection between model and cyber units of CPS robot system.

Lectures: 20 hours

## **Course description:**

Units and contexts in CPS system. CPS operation related objects in system-based engineering model. Driving contexts between modeled and operating CPS.

Model definition of robot system Model structure an representation related issues: robot control, direct and invers kinematics, velocity and acceleration, motion sets, and kinematic relations

Contextual realistic robot simulation. Situation and event driven communication within virtual CPS and with its operating CPS connection.

Information technology, computing, and mathematical means for relevant knowledge, experience, and expertise representation and communication.

Robot system behavior and its simulation and validation.

## Laboratory support

Students understand principles, methods, contextual connections and system issues discussing related issues on most advanced experimental models. These models are developed for this subject in the cloud environment of 3DEXPERIENCE system.

Course title: Statistical Hypothesis Testing

Lecturer: Márta Takács, professor, PhD takacs.marta@nik.uni-obuda.hu

**Course objective:** The goal of the subject is to present statistical hypothesis testing methods applied in engineering researches.

Lectures: 20 hours (partially in consultative forms)

## The subject prerequisites: basic mathematical and probability knowledge

## **Course description:**

Event mathematics and basic probability theory (review). Mathematical statistics – the basic definitions. Collecting, summarizing and visualizing data.Descriptive statistics. Distribution of sampling statistics. Point estimation and confidence intervals. Bivariate and multivariate analysis. Correlation. Hypothesis testing. Inference with two populations. Goodness of fit. Regression. Using of statistical software tools (R, Matlab). Statistical methods related to the students' research fields – preparing a statistical investigation related to the students' thesis.

Evaluation method: classical colloquium, oral examination

# **PROGRAM OF APPLIED MATHEMATICS**

**Course title:** *Fuzzy Optimization and Decision Making* 

Lecturer: Róbert Fullér, professor, CSc <u>fuller.robert@nik.uni-obuda.hu</u>

Course objective: To explain:

- How to make decisions under uncertainty
- How to choose appropriate aggregation operators to decision process where trade-offs are allowed;
- How to solve linear programming problems with soft objective function and constraints;
- How to use fuzzy sets for finding a good compromise solution to multiple objective programs.

Lectures: 20 hours

### **Course description:**

Fuzzy set theory provides a host of attractive aggregation connectives for integrating membership values representing uncertain information. These connectives can be categorized into the following three classes union, intersection and compensation connectives. Union produces a high output whenever any one of the input values representing degrees of satisfaction of different features or criteria is high. Intersection connectives produce a high output only when all of the inputs have high values. Compensative connectives have the property that a higher degree of satisfaction of one of the criteria can compensate for a lower degree of satisfaction of another criteria to a certain extent. In the sense, union connectives provide full compensation and intersection connectives provide no compensation. In a decision process the idea of trade-offs corresponds to viewing the global evaluation of an action as lying between the worst and the best local ratings. This occurs in the presence of conflicting goals, when a compensation between the corresponding compabilities is allowed. Averaging operators realize trade-offs between objectives, by allowing a positive compensation between ratings. In goal programming we are searching for a solution from the decision set, which minimizes the distance between the goal and the decision set. In fuzzy programming we are searching for a solution that might not even belong to the decision set, and which simultaneously minimizes the (fuzzy) distance between the decision set and the goal.

**Evaluation method:** classical oral examination.

Course title: Neuro-fuzzy systems

Lecturer: Róbert Fullér, professor, CSc fuller.robert@nik.uni-obuda.hu

Course objective: Introduction to neuro-fuzzy systems.

Lectures: 20 hours

## **Course description:**

To enable a system to deal with cognitive uncertainties in a manner more like humans, one may incorporate the concept of fuzzy logic into the neural networks. The resulting hybrid system is called fuzzy neural, neural fuzzy, neuro-fuzzy or fuzzy-neuro network. Neural networks are used to tune membership functions of fuzzy systems that are employed as decision-making systems for controlling equipment. Although fuzzy logic can encode expert knowledge directly using rules with linguistic labels, it usually takes a lot of time to design and tune the membership functions which quantitatively define these linquistic labels. Neural network learning techniques can automate this process and substantially reduce development time and cost while improving performance. We will explain the most used fuzzy inference schemes (Tsukamoto, Takagi-Sugeno, Mamdani) and learning rules (delta, generalized delta, Kohonen). We will show how to minimize the error function in fuzzy reasoning schemes by neural networks.

Evaluation method: classical colloquium, oral examination

Course title: Neuro-symbolic hybrid artificial intelligence

Lecturer: Orsolya Csiszár, assistant professor, PhD csiszar.orsolya@uni-obuda.hu csiszar.orsolya@hs-aalen.de

**Course objective:** AI techniques, especially deep learning models, are revolutionizing the business and technology world. However, one of today's greatest challenges in deep learning is the increasing need to address the problem of interpretability and to improve model trasparency, performance, and safety (XAI: eXplainable Artificial Intelligence). Combining neural networks with continuous logic and multi-criteria decision-making tools can contribute to better interpretability, transparency, and safety in medical, engineering, and business applications. This approach, together with other evolving methods belongs to neuro-symbolic hybrid artificial intelligence; a novel area of AI research that combines traditional rules-based approaches with modern deep learning techniques. Neuro-symbolic models have been shown to obtain high accuracy with significantly less training data than traditional models. Neural networks and symbolic systems can complement each other's strengths and weaknesses, enabling systems that are accurate, sample efficient, and interpretable.

Lectures: 20 hours

## **Topics:**

- Introduction: Deep learning and its current limits
- Causality, causal reasoning
- Aggregation and intelligent decision-making: avaraging fuctions, conjunctions, disjunctions, mixed functions (uninorms, nullnorms)
- Elements of nilpotent fuzzy logic, nilpotent connective systems
- Elements of multi-criteria decision-making, preference modeling
- Hybrid approaches: intuitive vs. symbolic AI systems
- Oveview of methods to explain AI: local/global model-agnostic approaches
- Interpretable neural networks using fuzzy logic and MCDM tools

Course title: Convex functions

Lecturer: Árpád Baricz, professor, PhD baricz.arpad@nik.uni-obuda.hu

**Course objective:** The goal of this course is to give an overview about properties of convex, logarithmically convex, geometrical convex, generalized convex, quasi-convex functions.

Lectures: 20 hours

## **Course description:**

Properties of convex functions. Differentiable convex functions. Convex functions and their extrema. Inequalities for convex functions. Quasiconvex and quasiconcave functions. Logarithmically convex and concave functions. Geometrical convex and concave functions. Completely monotone functions and their properties. Bernstein functions and their properties. Logarithmically completely monotone functions and their properties. Generalized convex functions. Convex functions with respect to power means. Logarithmically and geometrically concave and convex distributions. Inequalities of Prekopa-Leindler type.

Evaluation method: classical oral examination.

Course title: Special functions

Lecturer: Árpád Baricz, professor, PhD baricz.arpad@nik.uni-obuda.hu

**Course objective:** In this course our aim is to give an overview on the main properties of the most important special functions, which appear in engineering sciences.

Lectures: 20 hours

## **Course description:**

Euler gamma and beta functions. Dirichlet integrals. Hurwitz and Riemann zeta functions. Stirling's asymptotic results on gamma function. Digamma function. Bohr-Mollerup theorem. Gauss and Kummer hypergeometric functions and their properties. Elliptic integrals. Airy functions. Bessel and modified Bessel functions of the first and second kinds. Integral representations. Product representations. Mittag-Leffler identities. Stieltjes transformations. Zeros of Bessel functions and their properties. Struve and Legendre functions. Coulomb wave functions. Generalized Marcum and Nuttall functions and their properties. Completely monotone Bessel functions and their properties.

**Evaluation method:** classical oral examination.

**Course title:** Sampling theorems for deterministic signals

Lecturer: Tibor Pogány, professor, PhD pogany.tibor@nik.uni-obuda.hu

**Course objective:** One of the most efficient method in digital to analog reconstruction of deterministic signals (element of certain function classes) is the Whittaker-Kotel'nikov-Shannon (WKS) sampling series. The mathematical background of sampling theorems, methods and truncation error evaluation are in the focus of the course.

Lectures: 20 hours

### **Course description:**

Elements of Fourier analysis; Fourier transform. Band-limited signals, Nyquist rate, WKS sampling series expansion. Poisson summation formula. Reproducing kernel Hilbert space and sampling. Sampling in Bernstein and Paley-Wiener spaces. Piranashvili theorem. Kramer's lemma. Irregular (non-uniform) sampling. Kadec <sup>1</sup>/<sub>4</sub>-theorem. Yen's approach to sampling signal reconstruction. Errors in reconstruction, error upper bounds. Aliasing in sampling reconstruction and non-band limited signals. Time-shifted and average sampling signal reconstruction.

**Evaluation method:** classical oral examination.

**Course title:** Sampling series reconstruction of stochastic signals

Lecturer: Tibor Pogány, professor, PhD pogany.tibor@nik.uni-obuda.hu

**Course objective:** The digital-to-analogue conversion of discretized/sampled stochastic processes in the mean-square sense (Balakrishnan, Parzen, 1957) and with probability 1 (Belyeav, Lloyd, 1959) we realize with the help of the Whittaker–Kotel'nikov–Shannon (WKS) sampling series. The course is a short invitation to mathematics of sampling reconstruction of stochastic signals (processes, random fields), with a comprehensive overeview of the reconstruction error analysis and estimation.

Lectures: 20 hours

## **Course description:**

Stochastic processes. Wide sense stationary (Hinčin stationary) stochastic processes. Harmonizable processes. Correlation function, covariance function, spectral representations. Karhunen–Cramér- Piranashvili theorem. Bandlimited stochastic processes. Random fields, isotropic and homogeneous random fields. Hilbert space of stochastic processes. Piranashvili's theorems; Piranashvili-, Loév-, Rozanov- and Cramér-type processes. Reconstruction results by Lee; characterization theorems of almost sure sampling reconstruction by Gladyshev. Non-standard (irregular) sampling. Kadec's 1/4 –theorem and Yen's sampling reconstruction models. Reconstruction errors, truncation error, truncatione error upper bounds. "Aliasing" and non-bandlimited processes. Sampling restoration of random fields (Parzen, Someya). "Time shifted" sampling reconstruction. Whittaker's plane sampling.

Course title: Fuzzy-based Decision Making

Lecturer: Márta Takács, professor, PhD takacs.marta@nik.uni-obuda.hu

**Course objective:** The goal of the subject is to present the basic fuzzy-based decision making models applied in engineering researches and risk analysis.

Lectures: 20 hours (partially in consultative forms)

## The subject prerequisites: basic mathematical knowledge

## **Course description:**

Uncertainty and fuzzy set representation. Operations on fuzzy sets. Fuzzy logic. Fuzzy inference mechanism/approximate reasoning. Rule-based inference. Mamdani and Takagi-Sugeno systems. Anfis systems. Fuzzy based classification models – related big data analysis possibilities. Fuzzy reasoning methods based on novel constructed operator families. Risk management systems based on fuzzy decision models. Construction of complex, fuzzy based, decision and inference simulation systems. Fuzzy models related to the students' research fields – preparing a fuzzy based simulation model related to the students' thesis.

Course title: Reduction techniques of fuzzy decision systems

Lecturer: Edit Ludányi-Laufer, professor, PhD laufer.edit@bgk.uni-obuda.hu

**Course objective:** The aim is to introduce fuzzy approach and related concepts. The different complexity reduction techniques are demonstrated, which has vital importance in real-time and adaptive systems. Different rule base reduction techniques are investigated.

Lectures: 20 hours

## **Course description:**

Fuzzy set theory. Fuzzy operators. Fuzzy inference systems. Complete (or dense) rule base. Rule base reduction techniques. Sparse rule base. Merging inputs, or antecedent sets. Dividing into subsystems, creating a hierarchical system. Singular value decomposition. Discretization of the output.

Evaluation method: classical oral examination.

Course title: Numerical methods in model fitting problems

Lecturer: Emőke Imre, associate professor, PhD, habil imre.emoke@kvk.uni-obuda.hu

**Course objective:** To introduce the concept of parameter identification in relation to fitting of linear and non-linear models on measured data. To develop skills to solve these problems with own software, based on library subroutines.

Lectures: 20 hours

## **Course description:**

Part 1 (basic models). Solution of non-linear equations. Direct and iterative solution of linear equations. SVD and generalized inverse. Interpolation & curve fitting. Numerical differentiation and integration. Analytical and numerical solution of ODE-s and PDE-s. Numerical problems of the analytical solution of ODE and PDE systems.

Part 2. (model fitting methods) Parameter identification in relation to fitting of linear and nonlinear models on measured data. Classical and new methods with function value evaluation and with derivatives. Error estimation and reliability testing methods based on probability and geometry.

**Evaluation method:** classical oral examination.

Course title: Models of Unsaturated Soil Mechanics

**Lecturer:** Emőke Imre, associate professor, PhD, habil <u>imre.emoke@kvk.uni-obuda.hu</u>

**Course objective:** The continuum mechanical models of unsaturated soils contain material functions instead of material parameters. The determining the soil physical functions of unsaturated soils is not straightforward due to the long measurement times. The role of mathematical methods is crucial both in the evaluation of measurements (inverse analysis - parameter identification) and in the approximation of interpolation based on grain size distribution. The practical applications are presented including some large computer programs. Some discrete modeling issues - based on the statistical parameters of the grain size distribution (PSD) - is treated, including filter and internal stability rules, moreover, interpolation methods.

Lectures: 20 hours

Prerequisites: - (recommended: mechanics, soil mechanics)

# **Course description:**

Two major issues, continuum-mechanical modeling of soils and discrete modeling of soils are discussed.

- 1. Basics of unsaturated soil modeling. The concept of unsaturated soil, the continuummechanical approach. Compressibility of the soil air-water system, capillary phenomena, suction. The state variables. Fundamentals of material equations and material functions (water retention curve, permeability function).
- 2. Modeling of water flow in soil (permanent, transient, one-phase, multiphase). Partial differential equations and PDE systems. Numerical and analytical solutions, boundary conditions, input soil functions. Modeling of strength and compressibility, critical state modeling.
- 3. Measurements of unsaturated soils. Nonlinear and linear model fitting for measurement data. Classic and new methods. Uniqueness and error of the identified parameters, reliability test with statistical and geometric methods.
- 4. Applications. Numerical solution of water flow PDE-s. The concept of municipal waste and the unsaturated soil model. Numerical solution of flow modeling in flood protection dams and in aquifers,. Volume-change of swelling soils and rise. Presentation of finite element computer programs (GEO-SLOPE family, HBM, Soil-vision water flow modeling family, can be used free of charge for educational purposes). Simulations with water flow and slope stability programs.
- 5. The entropy of a finite, discrete distribution. Grading entropy and its use to determine the functions of unsaturated soils, to design of filter composition in dams (grain size distribution for proper filtration and internal stability). Approximate interpolation methods based on grain size distribution entropy to approximate soil function grain size distribution type models

Course title: Packing, covering and the application of packing and covering

Lecturer: Antal Joós, associate professor, PhD joosa@uniduna.hu

**Course objective:** Introduction to packing and covering theory. The application of packing and covering.

Lectures: 20 hours

## **Course description:**

Some application: wrapping and sphere packing; arrangement of atoms and sphere packing; error correcting codes and sphere packing; wifi coverage and covering by balls; covering of the surface of the Earth by satellites and covering by balls; covering of an area by transmission towers and multiple covering of the plane by circles.

Circle packing and covering on the plane, in higher dimensional space and on the sphere. Periodic circle packing and covering. Estimate of density. Circle packing in a finite container (in a square, triangle, disc, cube). Circle covering of a finite set. Packing squares and rectangles.

Evaluation method: classical colloquium, oral examination

Course title: Equilibria on Riemannian-Finsler manifolds

Lecturer: Alexandru Kristály, professor, PhD kristaly.alexandru@nik.uni-obuda.hu

**Course objective:** to provide an introduction into the theory of equilibrium problems, starting from the classical Euclidean notions to their geometric correspondents, formulated in terms of Riemannian and Finsler geometries. These problems provide faithful models to various phenomena in the theory of optimization on not necessarily flat spaces.

Lectures: 20 hours

Prerequisites: Calculus I

## **Course description:**

Riemannian and Finsler manifolds (motivation and examples). Asymmetric Finsler manifolds (Matsumoto mountain slope). Geodesics on Riemannian and Finsler manifolds (connections and examples). Nonsmooth functions (derivatives). Convexity on manifolds. Dynamical systems on manifolds (invariance properties). Metric projections on manifolds (influence of the curvature). Weber-type transport problems (symmetry vs asymmetry). Nash-Stampacchia equilibria on Riemannian manifolds. Stackelberg equilibria on Riemannian manifolds (leader-follower strategies).

**Evaluation method:** classical oral examination.

Course title: Calculus of variations and applications in partial differential equations

Lecturer: Alexandru Kristály, professor, PhD kristaly.alexandru@nik.uni-obuda.hu

**Course objective:** to provide an introduction into some problems formulated in terms of the Calculus of Variations, i.e. to find minimum/maximum or minimax points of certain energy functionals. Variational arguments (minimization methods, mountain pass theorem, saddle point theorem) and group-theoretical arguments will be combined to solve various elliptic partial differential equations.

Lectures: 20 hours

### Prerequisites: Calculus I

### **Course description:**

Historical background (brachistochron problem, Fermat principe, Zermelo navigation problem, etc). Minimization arguments. Ekeland variational principle. Ricceri variational principle. Borwein-Preiss variational principle. Critical points. Deformation lemma. Palais-Smale compactness condition. Minimax theorems. Mountain pass theorem. Saddle point theorem. Szulkin-type functionals. Multiplicity results. Principle of symmetric criticality. Rubik-type group actions. Symmetric Sobolev spaces. Compact embeddings. Variational inequalities. Nonlinear eigenvalue problems. Elliptic problems (with Dirichlet/Neumann boundary conditions). Schrödinger-type equations.

**Evaluation method:** classical oral examination.

Course title: Differential Geometry and Calculus of Variations

Lecturer: Peter T. Nagy, professor emeritus, DSc nagy.peter@nik.uni-obuda.hu

**Course objective:** The course deals with the basic task of calculus of variations. It applies the theory of extremal curves to the variational problems of classical mechanics and to the theory of geodesics of Riemann and Finsler spaces.

Lectures: 20 hours

### **Course description:**

Geometry of curves and surfaces. The spherical image of surfaces, Gauss map. Lagrangian mechanics. The basic task of calculus of variation, Euler-Lagrange equations. The Legendre transformation. Second variation, sufficient conditions. Conjugate points, Jacobi's differential equations. Differentiable manifolds, tangent bundle. Riemann and Finsler manifolds. Levi-Civita connexion, curvature. Spaces of constant curvature. Lagrange mechanics on manifolds. D'Alambert principle. Free rotation of rigid bodies. First and second variations of arc-length in Riemann and Finsler spaces. Geodesics, exponential map, normal neighbourhood. Curvature tensor, Jacobi fields. Curvature and conjugate points. Minimizing property of geodesics. Gauss's lemma. Riemann and Finsler space as metric space. Completeness, Hopf-Rinow theorem. Spaces of negative curvature, Hadamard's theorem.

Course title: Basics in Optimal Control

Lecturer: József K. Tar, professor, DSc tar.jozsef@nik.uni-obuda.hu

**Course objective:** To provide the Students with the fundamental mathematical tools of optimal controllers.

Lectures: 20 hours

## **Course description:**

Optimization under constarints, Lagrange multipliers and the Reduced Gradient Method, the auxiliary function. Simulation examples using the MS EXCEL-SOLVER-VISUAL BASIC programming tools for discrete time approximation. Turning to the continuous time approximation: the co-state. Formulation used by the variational calculus, artificial energy (Hamiltonian) function, analogy with Classical Mechanics' Hamiltonian formulation and the flow of incompressible fluids. Certain special cases: the LQR controller, Riccati equations. Adaptive solution with Fixed Point Iterative methods based on the concept of Banach Space and Banach's Theorem.

**Evaluation method:** classical oral examination.

**Course title:** Near optimal solution of the inverse kinematic task of redundant, non-special robot arms using differential approaches

Lecturer: József K. Tar, professor, DSc tar.jozsef@nik.uni-obuda.hu

**Course objective:** To provide the Student with the fundamental, Group Theory-based formulation of the forward and investe kinematic task of non-special redundant robot arms.

Lectures: 20 hours

## **Course description:**

Rotation and shift of rigid bodies: the Orthogonal Matrices. Groups, continuous groups, group algebra, Lie Groups, the Lie graoup as an embedded hypersurface, the tangent space at the identity element, exponential functions, transformed tangents at the identity elements, Lie algebra, structure coefficients, Clebsch-Gordan series. Representation of Lie Groups: quaternions, spinors, Clifford Algebras. Homogeneous matrices and the Special Euclidean Group. The Forward kinematic task. The differential inverse kinematic task. Optimization under constarints, Lagrange multipliers and the Reduced Gradient Method, the auxiliary function. Generalized inverses for redundant robot arms: the Moore-Penrose pxeudoinverse, Singular Value Decomposition (SVD) and the SVD-based pseudoinverse, problem solution by the use of the Gram-Schmidt Algorithm, kinematic singularities. Iterative methods based on the concept of Banach Space and Banach's Theorem.

Lecturer: József K. Tar, professor, DSc tar.jozsef@nik.uni-obuda.hu

**Course objective:** To provide the Students with the recently developed geometric approach in the adaptive control of nonlinear systems

Lectures: 20 hours

### **Course description:**

The use of approximate models in adaptive control: Kolmogorov's universal approximators, neural networks and fuzzy systems-based models, tensor product models, Weirstarss' and Stone's approximators. Scaling problems. The expected and realized response model. Transformation of the control task into an iteration. Antecedents: the use of spacial Lie groups for problem formulation. Banach spaces, Banach's Theorem. Applications for SISO and MIMO systems. Application examples.

Course title: Mathematical Methods, and Programming for Control Theory

Lecturer: Krisztián Kósi, PhD kosi.krisztian@nik.uni-obuda.hu

**Course objective:** To give the students an overview of mathematical methods used in Control Theory. the course contains a programming part that shows the algorithms in Julia language and discusses the coding efficiency in sense of efficient code writing, and efficient code running time.

Lectures: 20 hours

# **Course description:**

The course contains the generatlization of real numbers' space:

- Metrics, Metric Spaces, Convergent Series in Metric Space, Norm, Normed Space, Banach Space, Banach's Fixed Point Theorem.
- Solving Linear and Non-Linear equations.
- Solving Linear and Non-Linear ODE systems, with numerical methods.
- Gram-Schmidt method.
- Homogeneous Matrices, and Rodriguez Formula.
- Mathematical model making, Euler-Lagrange equations.

Advantages of using Unix or Linux type operating systems. Terminal-based shell commands, scripts, and programs.

Course title: Non-Linear control with Fixed Point Iteration -based methods

Lecturer: Krisztián Kósi, PhD kosi.krisztian@nik.uni-obuda.hu

**Course objective:** To give the students an overview of the Non-Linear control. The course contains the necessary mathematical tools, and extends the basic ideas of the Non-Linear systems to the Adaptive Non-Linear control. The Examples are coded in Julia language.

Lectures: 20 hours

## **Course description:**

The course contains certain fundamental physical and mathematical issues as

- Necessary mathematical and software tools
- Lagrangian Mechanics
- Introduction to Nonlinear Systems
- Stability in sense of Lyapunov
- Lyapunov's "first" method to determine stability
- Introduction to Lyapunov's "second" method
- Barbalat's lemma, and introduction to Robust Control
- Example: VS/SM controller
- Introduction to Adaptive Control
- Fixed Point Iteration –based control
- Example for SISO Systems
- Example for MIMO Systems
